Description

Many of the more sophisticated users start JD with a script. The File - Restart command and the restart after upgrade use a standard command line that is not acceptable to many of us. Many of us need Java parameters in the command line for proper operation.

Proposal: If a file `_JDrestart` (with a script extension appropriate to the platform) exists in the JDownloader directory, then that should be executed instead of the default command line. The extensions for Windows would be `.bat` and `.com`. The extensions for OS-X, Unix, and Linux would be `.ksh`, `.tsh`, `.bash`, or no extension. JD would just search for a file in a built-in list and make a `System()` call (it is not necessary to have different lists for platforms).
