Description

Several users have requested the ability to use multiple concurrent proxies to concurrently download.

As one user put it: The main reason for using proxies is to download multiple files from the host.

Several users have multiple network cards in their computer and request use of the NICs for concurrent downloads.

The advice to date for both cases has been to run multiple copies of JD, one for each NIC or proxy.

Users have also asked for a display of the proxy being used in the link's line in the Downloads grid. This writer does not consider this a necessary feature.
