Category: Addon	Estimated time: 3.00 hours
Target version: 040 - FarfarAway	
Resolution:	
Description When the JDownloader JAC system has no JAC module for a host, and this addon is enabled, the external program that is set should be called with two command line parameters: 1) The hostname (such as "coldfile.com" in UTF-8) 2) The filename within the jdownloader\captchas directory that contains the captcha challenge image as a JPEG file. The filename should be in UTF-8. The external program will return the response in its STDOUT (UTF-8), followed by a newline (\x0a = \n). If no response is found, only the newline will be returned. A setting should exist for this addon as to whether all AntiCaptcha prompts will instead be redirected to the addon (any JAC module results that do not reach the certainty level would normally be displayed for the user. If this setting is "All challenges without an answer" then the challenge will go to the plugin and there will be no user AC prompts).
