Category:	Refactoring	Estimated time:	0.00 hour
Target version:	040 - FarfarAway		
Resolution:	Fixed		

Description

Once LG has determined that it has found the beginning of a URI, it should continue parsing the URI until a character or sequence is found that may not be in a URI. The default should be to **include** all links that are not explicitly excluded. Furthermore, the attributes (query fields) in the URI should all be retained except for those that are explicitly excluded.

In the past year, there have been several requests to add new extensions and several changes required because attributes are not included.
