Target version:	010 - Next Major Public Release 1.xxx		
Resolution:	No feedback		

Description

The script collection needs to ask for ISP, Brand, Model, version, and firmware revision as separate fields in the same dialogue. Asking for the information piecemeal causes confusion. All four pieces of information are normally available by opening the browser to the Router address.

After a few months, we can start filtering for router Brand and Model based on what has been seen. If the Brand or Model is new, the collection addon should ask the user to confirm the information.
