Description			
http://board.jdownloader.org/showthread.php?t=48587			
"As is stated, OS X mounts the drives in /Volumes with their drive name: /Volumes/drivename If JD creates that path due to a missing drive, then when the actual drive is mounted it mounts under the revised name because you can't have 2 drives named exactly the same, thus: /Volumes/drivename /Volumes/drivename 1 If /Volumes/drivename is deleted and the actual drive is ejected and mounted again it should come up without the 1 again. FYI, you can access /Volumes in the Finder via the menubar at "Go -> Go to Folder..." and enter "/Volumes". "
